

codes. 2.2 Minimal encoders. 2.2.1 An algorithm that generates minimal encoders. 2.2.2 Minimal encoders have the predictable span property. 2.2.3 Other properties of minimal encoders. 2.3 Basic encoders: an intermediate step to obtain minimal encoders. 2.3.1 Euclid's algorithm. 2.3.2 A simple algorithm to construct minimal encoders. 2.3.3 Equivalent basic encoders and basic encoders of subcodes. 2.4 Encoders of dual codes and of reciprocal codes. 2.5 Comments. *Chapter 3: How to choose and to use a convolutional encoder.* 3.1 Distance measures for the evaluation of convolutional codes. 3.2 State diagrams and enumerators of convolutional encoders. 3.3 Decoding of convolutional codes. 3.3.1 The Viterbi algorithm. 3.3.2. The stack algorithm. 3.3.3 Perfect syndrome decoding. 3.3.4 Nonperfect decoding methods. 3.4 Distance profile and column distance function of a convolutional encoder. 3.5 Some constructions for binary convolutional codes. 3.6 The zero run problem. 3.7 Comments 3.8 Appendix: A conjecture on the minimum symbol distance of $(2, 1)$ binary codes. 3.9. Appendix: Sketch of the bound obtained by Zigangirov. *Chapter 4: Convolutional codes with automorphisms.* 4.1 Sliding sets and associated graphs. 4.1.1 General sliding sets. 4.1.2 Sliding groups. 4.1.3 Systematic sliding groups. 4.2 Automorphisms of convolutional codes. 4.2.1 Definition and general properties of the automorphisms of a convolutional code. 4.2.2 Computation of the automorphism group of a convolutional code. 4.3 Some other properties of $\text{Aut}_K(C)$. 4.4 Comments. *Chapter 5: When is $\text{Aut}_K(C)$ an infinite group?* 5.1 General conditions for $\text{Aut}_K(C)$ to be an infinite group. 5.2 Automorphisms of dense codes. 5.3. Other conditions on $(\text{Aut}_K(C))^{(0)}$ when $\text{Aut}_K(C)$ is infinite. 5.4 Appendix: The stabilizer of a subspace of F^n in $GL(n, F)$. *Chapter 6: Further properties of groups, rings and modules.* 6.1. Further properties of groups. 6.1.1 Centralizers and normalizers. 6.1.2 The regular representation of an abstract group. 6.2 Rings and modules. 6.2.1 Modules and their properties. 6.2.2 Further properties of rings. 6.3 An example of the structure of ideals. *Chapter 7: Structure and decomposition of H -codes.* 7.1 General structures of H -codes. 7.2 Normal sequences and generated modules. 7.3 Canonical minimal encoders for H -codes. 7.4 Comments. *Chapter 8: Equivalences between convolutional codes.* 8.1 Properties of the K^Z -equivalences between convolutional codes. 8.2 Convolutional K^Z -equivalences preserving automorphisms. 8.3 Determination of the convolutional K^Z -equivalences. 8.4 Comments. *Chapter 9: Semiregular convolutional codes.* 9.1 Definition of semiregular codes. 9.2 Normal sequences in semiregular convolutional codes. 9.3 Minimal encoders for regular Abelian codes. 9.4 Convolutional K^Z -equivalences for regular codes. 9.5 Comments. *Chapter 10: Construction of codes with a large symbol distance.* 10.1 Codes of length 6. 10.2 Codes of length 7. 10.3 Codes of length 9. 10.4 Codes of length 10. 10.5 Codes over $GF(2^4)$ and concatenated binary codes. 10.6 Longer binary codes. 10.7 Comments. *Chapter 11: Convolutional codes that are good for some nonstandard criteria.* 11.1 Binary word error correcting codes. 11.1.1 Representation of a class of binary convolutional codes. 11.1.2 Error correcting properties of the codes generated by free encoders. 11.1.3 Properties of the codes generated by reduced encoders. 11.2 Codes for compound channels. 11.2.1 The distance repartition of some binary $(7, 3)$ convolutional codes. 11.2.2 The distance repartition of some binary convolutional codes of length 9. 11.3 Unequal error protection by means of convolutional codes. 11.4 Channel correcting convolutional codes. 11.4.1 MDS codes over field of Laurent series. 11.4.2 A simple method to construct MDS convolutional codes. 11.4.3 Decoding methods of channel correcting convolutional codes. 11.5 Comments.

Shaping Space: A Polyhedral Approach. Edited by Marjorie Senechal and George Fleck (Birkhauser, Bonston, Basel, 1988) 284 pages.

Part 1. The First Steps. 1. A Visit to the Polyhedron Kingdom, MARJORIE SENECHAL. The regular "solids". Direct descendants. An architectural walking tour. The nature preserve. The gallery of polyhedral art. A note on polyhedral society. The polyhedral fair. Where to go from here. 2. Five recipes for making polyhedra. A. Constructing Polyhedra without Being Told How to? MARION WALTER. Getting started: How to attach polygons. What shape are you going to make? Shapes you can make with triangles. A note to the teacher. A word about materials. B. Constructing Pop-up Polyhedra, JEAN PEDERSEN. Required materials. General instructions for preparing the pattern pieces. Constructing the cube. Constructing the octahedron. C. The Great Stellated Dodecahedron, MAGNUS WENNINGER. Getting started. Assembling the model. D. Creating Kaleidocycles and More,

DORIS SCHATTSCHNEIDER. Folding strips of triangles. Kaleidocycles. The isoaxis. Further exploration. Information on construction materials. E. The Rhombic Dodecahedron: Its Relation to the Cube and the Octahedron, ARTHUR L. LOEB. The pyramids. Construction of the polyhedra. Juxtaposition of polyhedra. Space-fillers. A note on materials (contributed by JACK GRAY). *Part II. Lectures from the Shaping Space Conference.* 3. Regular and Semiregular Polyhedra, H.S.M. COXETER. 4. Milestones in the History of Polyhedra, JOSEPH MALKEVITCH. 5. Polyhedra and Crystal Structures, CHUNG CHIEH. 6. Polyhedra: Surfaces or Solids?, ARTHUR L. LOEB. 7. Spatial Perception and Creativity, JANOS BARACS. 8. Why Study Polyhedra?, JEAN PEDERSEN. Jennifer's puzzle. Jennifer's instructions. How to make the puzzle pieces. Assembling the polyhedra. Putting the puzzle together. Variations and modifications. *Part III. Roles of Polyhedra in Science.* 9. Form, Function, and Functioning, GEORGE FLECK. Does form explain function? Science looks to geometry for models. Plato's ideas. Spheres and polyhedra as models for matter. Spheres and whirlpools as models for atoms and molecules. Polyhedra as models for atoms, molecules, and viruses. Modeling condensed matter. Packing of spheres of various sorts. Polyhedra as models for plant structures. Does form explain dynamic functioning? Science looks to geometry for mechanistic models. Plant growth and polyhedral transformations. Polyhedral models for self-assembly of viruses. Robotics and motions of polyhedra. Polyhedron theory accommodates changing expectations. 10. Polyhedral Molecular Geometries, ISTVÁN HARGITAI AND MAGDOLNA HARGITAI. Boron hydride cages. Polycyclic hydrocarbons. Structures with a central atom. Regularities in nonbonded distances. The VSEPR model. Consequences of intramolecular motion. *Part IV. Theory of Polyhedra.* 11. Introduction to Polyhedron Theory, MARJORIE SENECHAL. What is a polyhedron? Why a theory of polyhedra? Polyhedral themes. A word of warning. Notes. 12. Combinatorial Prototiles, EGON SCHULTE. Nontiles. Constructions of monotypic tilings. 13. Duality of Polyhedra, BRANKO GRÜNBAUM AND G.C. SHEPHARD. 14. Polyhedral Analogues of the Platonic Solids, J.M. WILLS. Platonohedra. Construction of the platonohedra. Regular polyhedra. The flag diagram. 15. Uniform Polyhedra from Diophantine Equations, BARRY MONSON. Interlude. Uniform polyhedra with icosahedral symmetry. 16. Torus Decompositions of Regular Polytopes in 4-Space, THOMAS F. BANCHOFF. Decompositions. The cube and its associated polyhedra. The hypercube and its associated polytopes. Fold-out decomposition of the hypercube and 24-cells. Cartesian and torus coordinates. Coordinates for polyhedra and polytopes. The Hopf mapping. The Hopf decomposition of the hypercube. Torus decomposition of the 24-cell. Conclusion. 17. Convex Polyhedra, Dirichlet Tessellations, and Spider Webs, PETER ASH, ETHAN BOLKER, HENRY CRAPO, AND WALTER WHITELEY. Cell decompositions and reciprocal figures. Spider webs and projections. The main result. Realizations of abstract graphs. Infinite plane examples. Notes. 18. Unsolved Problems. A. Can Neighborly Polyhedra Be Realized Geometrically?, JOHN REAY. Historical Background. Unsolved Problems. B. How Many Faces Does a Polytope Have?, MARGARET BAYER. C. Problems on the Realizability and Rigidity of Polyhedra, WALTER WHITELEY. Realizability. Infinitesimal rigidity. Unique realizability. Dihedral angles and locally unique realizability. Concluding remarks on the design of spatial polyhedra. D. Problems Concerning Polyhedral 2-Manifolds, PETER GRITZMANN. E. Extending the Conway Criterion, DORIS SCHATTSCHNEIDER. *Part V. Further Steps.* 19. Polyhedra and Curriculum? MARJORIE SENECHAL AND GEORGE FLECK.

Combinatorial Geometries, Edited by Neil White (Cambridge University Press, Cambridge, New York, New Rochelle, Melbourne, Sydney 1987) 212 pages.

1. *Coordinatizations*, Neil White. 1.1 Introduction and basic definitions. 1.2 Equivalence of coordinatizations and canonical forms. 1.3 Matroid operations. 1.4 Non-coordinatizable geometries. 1.5 Necessary and sufficient conditions for coordinatization. 1.6 Brackets. 1.7 Coordinatization over algebraic extensions. 1.8 Characteristic sets. 1.9 Coordinatizations over transcendental extensions. 1.10 Algebraic representation. 2. *Binary Matroids*, J.C. Fournier. 2.1 Definition and basic properties. 2.2 Characterizations of binary matroids. 2.3 Related characterizations. 2.4 Spaces of circuits of binary matroids. 2.5 Coordinatizing matrices of binary matroids. 2.6 Special classes of binary matroids; graphic matroids. 2.7 Appendix on modular pairs of circuits in a matroid. 3. *Unimodular Matroids*, Neil White. 3.1 Equivalent conditions for unimodularity. 3.2 Tutte's Homotopy Theorem
